Publication No. US2003009599A1
Publication No. US2003009599A1
REDEBRAL INFORMATION:
APPLICANT: Cincinnati Childrens Hospital Research Foundation
APPLICANT: Cincinnati Childrens Hospital Research Foundation
TITLE OF INVENTION: Eusogenic Properties of Saposin C and Related Proteins and Portice of INVENTION: Fuse of Papilication to Transmembrane Drug Delivery Systems
FILE REFERENCE: 10872/0474352
CURRENT APPLICATION NUMBER: US 60/181,754
PRIOR APPLICATION NUMBER: US 60/181,754
PRIOR FILING DATE: 2000-02-11
NUMBER OF SEQ ID NOS: 2
SOFTWARE: Patentin version 3.0
                                                                                                                APPLICANT: JENGRALD.

APPLICANT: JENSEN, ANNE DAM
APPLICANT: JENSEN, ANNE DAM
APPLICANT: JENSEN, ANNE DAM

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

inflammatory neurodegenerative disease; toxin induced liver disease.
                                                                                                                                                                                                                Gaps
                                                      A consensus sequence was determined by comparing the peptide with hematopoietic and neuropoietic cytokines, and neuropoietic peptide with hematopoietic and neuropoietic cytokines, and neurotrophic peptides neurotrophic factor, interleukins-6, -2, -3 and -gamma, erythropoietin and leukocyte inhibitory factor, and neurotrophic factor, and neurotrophic factor, and neurotrophic factor, and neurotrophic factor, and and neurotrophic factor, and and oncestatin-M. Prosaponin (AAR70783) and saposin-C also promoted nerve cell myelination ex vivo.
                                             The peptide given in AAR70773, corresponding to amino acids 8-29 of

prosaposin derived proline residues. Prosaposin, saposin C and prosaposin derived peptides (prosaptides), have therapeutic applications in promoting recovery after toxic, traumatic, myocardial ishchaemic, degenerative and inherited lesions to the peripheral and central nervous system. Prosaposin receptor agonists (PRAs) inhibit proinflammatory cytokine induced apoptosis by activation of the Ser/Thr protein kinase Akt. Akt dissociates complexes of Bcl-2 family members, such as BAD-Bcl-2, releasing Bcl-2 and its family members, such as BAD-Bcl-2, releasing Bcl-2 and its family members, which inhibit caspases, thereby inhibiting apoptosis. An additional mechanism whereby PRAs inhibit apoptosis is by blocking activation of JNK, a proapoptofic signaling component. Within several minutes after binding to the receptor, PRAs block JNK activation induced by tumor necrosis factor-alpha (TNF alpha). The activation of JNK by TNF alpha is another well known mechanism for activation of JNK by TNF alpha is another well known mechanism for TNF alpha-induced, as well as other proinflammatory cytokine, for example TNF alpha or interferon-gamma. It can be used for inhibiting apoptosis which is caspase-mediated with a disorder such as e.g. rheumatoid activation, congestive heart failure, multiple sclerosis, acute disseminated inflammatory leukoencephalitis, progressive multifocal leukoencephalitis, Alzheimer's disease, Parkinson's disease, ischemic heart disease, Guillain-Barre disease, Parkinson's disease, ischemic carboral cord injury, alopecia, AlDS dementia, cerebral malaria, natured disease, Saposin C acts as a prosaposin receptor agonist.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

degenerative, neurological and/or auto-immune disease. The polynucleotides and polypeptides are used for diagnosis, prognosis, prevention and treatment of multiple sclerosis (in its various forms and phases). They may also be useful in cases of e.g. Alzheimer's and Parkinson's diseases, amyotrophic lateral sclerosis, rheumatoid polyarthritis and lupus erythematosus, including use as vaccines and in gene therapy (expression of sense or antisense sequences). They can also be used to assess efficacy of potential therapeutic agents, particularly compounds that reduce or inhibit toxicity towards glial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (OBRIZ) OBRIEN J S.

                                                                                                                                                                                                                                                                                                                  ö
                                                                                                            co-factor for the lysosomal enzyme glucocerebrosidase, GCB. GCB is the enzyme involved in Gaucher's disease, a lysosomal storage disease. The involved in Gaucher's disease, a lysosomal sites into lysosomal enzymes/activators like GCB to improve their bloactivity. The novel polypeptides are used for the prevention and treatment of Gaucher's disease, Farber's disease, G_m.l gangliosidosis, Tay-Sach's disease, Niemann-Pick disease, Shindler disease, Hunter syndrome, Sly syndrome, Hurler and Huler/Scheie

A consensus sequence was determined by comparing the peptide with hematopoletic and neuropoletic cytokines, and neurotrophic peptides (AAR70774-82) were identified in the AB loop of human ciliary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              neurotrophic factor, interleukins-6, -2, -3 and -gamma, erythropoietin and leukocyte inhibitory factor, and in helix C of human interleukin-1-beta and oncostatin-M. Prosaponin (AAR70783) and saposin-C also promoted nerve cell myelination ex vivo.

Prosaposin, saposin C and prosaposin derived peptides (prosaptides), have therapeutic and increasing a promoting recovery after toxic, traumatic, myocardial ishchaemic, degenerative and inherited lesions to the peripheral and central nervous system. Prosaposin receptor agonists (PRAs) inhibit prolinflammatory cytokine-induced apoptosis by activation of the Ser/Thr protein kinase Akt. Akt dissociates complexes of Bcl-2 thanks which inhibit caspases, thereby inhibiting apoptosis. An additional mechanism whereby PRAs inhibit apoptosis ab b blocking activation of JNK, a proapoptoric signaling component. Within the servant minutes after binding to the receptor, PRAs block JNK activation of JNK by TWF alpha is another well known mechanism for activation of JNK by TWF alpha is another well known mechanism for TNF alpha-induced, as well as other proinflammatory cytokine-induced apoptosis. The method can be used for inhibiting apoptosis which is

caspase-mediated or induced by a proinflammatory cytokine, for example TNF alpha or interferon-gamma. It can be used for inhibiting apoptosis associated with a disorder such as e.g. rheumatoid arthritis, Crohn's disease, irritable bowel syndrome, asthma, cardiac infarction, congestive heart failure, multiple sclerosis, acute disseminated inflammatory leukoencephalitis, progressive multifocal leukoencephalitis, Alzheimer's disease, Parkinson's disease, amyotrophic lateral sclerosis, Huntington's disease, ischemic heart disease, Guillain-Barre disease, traumatic brain injury, traumatic spinal cord injury, alopecia, AlDS dementia, cerebral malaria, HTLV, neuropathy, inflammatory neurodegenerative disease, and toxin-induced liver disease. This 524 N terminal peptide of prosaposin also acts as a prosaposin receptor agonist.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Saposin B derived peptides, useful as inhibitors of angiogenesis and tumor growth -

The specification describes a method which us at least one polypeptide or polynucleotide sequence belonging to the perlecan, precursor of the retinol-binding plasma protein, precursor the ganglioside GM2 activator, calgranulin B or saposin B protein families. The method is used for detecting, preventing or treating a degenerative, neurological and/or auto-immune disease. The polynucleotides and polypeptides are used for diagnosis, prognosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Detecting, preventing and treating degenerative, neurological and autoimmune diseases, particularly multiple sclerosis, using specified polypeptides or related nucleic acid or ligand -
                     antiproliferative and antimigratory activity against endothelial cells. This activity is conserved in cryptic polypeptides as small as 5 amino acids (see AAYS6684.715), which can be synthetically prepared and used in vitro or in vivo for the treatment of undesired angiogenesis and tumor growth, especially Kapoal's sarcome (claimed). The polypeptides can also be used in conjunction with cytotoxic moieties to selectively kill certain cell types, e.g. for treatment of cancer, angiofibroma, neconscular glaucoma, arteriovenous malformation, nonunion fracture, arthritis and other connective tissue disorders, Osler-Weber syndrome, atherosclerotic plaque, psoriabals, corneal graft necowsacularization, pyogenic granuloma, retrolental fibroplasia, diabetic retinopathy, acleroderma, haemangloma, trachoma, vascular adhesions and

ö
prevention and treatment of multiple sclerosis (in its various forms and phases). They may also be useful in cases of e.g. Alzheimer's and Parkinson's diseases, amyotrophic lateral sclerosis, rheumatoid polyarthritis and lupus erythematosus, including use as vaccines and in gene therapy (expression of sense or antisense sequences). They can also be used to assess efficacy of potential therapeutic agents, particularly compounds that reduce or inhibit toxicity towards glial

                                                                                                                                                                                                                                                             ö
                                                  The sequence is a fusion protein of human lysosomal enzyme glucocerebrosidase, GCB and its co-factor, Saponin C, SapC. GCB is the enzyme involved in Gaucher's disease, a lysosomal storage disease. The invention relates to introducing new glycosylation sites into lysosomal enzymes/activators like GCB to improve their bloactivity. The novel polypeptides are used for the prevention and treatment of Gaucher's disease, Farber's disease, G_m_l gangilosidosis, Tay-Sach's disease, Niemann-Pick disease, Shindler disease, Hunter syndrome, Sly syndrome, Hurler and Huler/Scheie
                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to use of a prosaposin-related peptide or derivative, in the production of a medicament for use in preventing or delaying cell death, or in promoting the expression of cell death supporting gene product Bcl-XL. The invention is useful for preventing the death of cells e.g. brain cells, neurons and cardiac muscle cells, in vitro or ex vivo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Use of prosaposin-related peptides or derivatives as cytoprotective agents, for suppressing apoptosis or apoptosis-like cell death
                                                                                                                                                                                                                                                             ö

The present invention describes a cyclic peptide of about 11-25 amino acids containing an analogue of the 11-mer active region of saposin C. The cyclic peptide has merroprotective, vasotropic, vulnerary, analogusic, antiParkinsonian and ophthalmological activities. It stimulates choline acetyltransferase activity. The peptide is used to induce myelination or inhibit demyelination in a mammal, especially a chuman, where demyelination is due to multiple sclerosis, ischaemic injury or traumatic injury, to inhibit neural degeneration or promote neurite outgrowth in neural issue and treat neuropathic pain. The peptide may also be useful treat parkinson's disease, retinal neuropathy, and ocular neurodegeneration leading to viston loss in the electry. The peptide can be used in research to study the effects of neurotrophic factors and myelin facilitating materials, and as components of cell growth media for facilitating and maintaining neural cells in vitro. The invention provides circular prosaposin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 peptidomimetics which are more resistant to proteolytic degradation and better able to cross the blood brain barrier than prior art linear peptides. The present sequence represents a human saposin C 22-mer peptide given in the disclosure of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DB 21; Length 21;

The present sequence represents a prosaposin-derived peptide. A method has been developed of alleviating or preventing neuropathic pain in a subject, comprising administering an effective amount of an active fragment of prosaposin to the subject. The prosaposin-derived peptide is useful for therapy of neural or demyelination disorders in neural tissue. It can be used to stimulate neurite outgrowth, inhibit neural cell death, promote myelination or inhibit demyelination. The method is used to alleviate neuropathic pain resulting from a peripheral nerve incomplete nerve transsection, monoeuropathy or polyneuropathy. Alternatively the neuropathic pain results from a disorder of the dorsal root ganglia, spinal cord, brainstem, thalamus or cortex.
neuropathic pain; peripheral nerve disorder; neuroma; mononeuropathy; polyneuropathy; dorsal root ganglia; spinal cord; brainstem; thalamus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               prosaposin; receptor agonist; neuropathic pain; neurite outgrowth; neural cell death; nerve disorder; side effect.

A consensus sequence was determined by comparing the peptide with hematopoietic and neuropoietic cytokines, and neurotrophic peptides (AAR70774-82) were identified in the AB loop of human ciliary neurotrophic factor, interleukins-6, -2, -3 and gamma, erythropoietin and leukocyte inhibitory factor, and in helix C of human interleukin-1-beta and oncostatin-M. Prosaponin (AAR70783) and saposin-C also promoted nerve cell myelination ex vivo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

The invention relates to prosaposin receptor agonists. Also claimed are: (1) methods for alleviating neuropathic pain or inhibiting the conset of neuropathic pain, comprising administering a prosaposin receptor agonist; (2) inhibiting sensory or motor neuropathy, comprising contacting neuronal cells with a composition comprising a prosaposin receptor agonist; (3) methods for stimulating neuristing a prosaposin comprising merial death, promoting myellination, or inhibiting neural cell death, promoting myellination, or inhibiting comprising contacting neuronal cells with a composition comprising a prosaposin receptor agonist which has 14-50 amino acids and comprises the sequence of a propasposin derived protein. The processes of may be used for treatment of neuropathic pain resulting from peripheral nerve disorders (e.g. neuroma, nerve compression, nerve clush, nerve cush, complete nerve transsection, mononeuropathy or polyneuropathy) or disorders of dorsal root ganglia, the spinal cord, the brainstem, the thalamus or the cortex. The receptor agonists do not cause undesirable side effects. The present sequence represents a specifically claimed by procession processed by a specifically claimed by a process of a prosaposin receptor agonist.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ő
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          irritable bowel syndrome; asthma; cardiac infarction; congestive heart failure; multiple sclerosis; sacute disseminated inflammatory leukoencephalitis; progressive multifocal leukoencephalitis; Alzheimer's disease; Parkinson's disease; amyotrophic lateral sclerosis; Huntington's disease; schemic heart disease; Guillain-Barre disease; alopecia; AIDS dementia; cerebral malaria; HTLV; neuropathy; inflammatory neurodegenerative disease; toxin-induced liver disease.

Prosaposin is a 70kDa glycoprotein which is proteclytically processed to generate saposins A, B, C and D, all of which are similar to each other and have a similar placement of six cysteines, a glycosylation of site and conserved prolline residues. Prosaposin, saposin C and a similar placement of six cysteines, a glycosylation constructed peptides (prosaptides), have therapeutic applications in promoting recovery after toxic, traumatic, myocardial ischemamic, degenerative and inherited lesions to the peripheral and central nervous system. Prosaposin receptor agonists (PRAs) inhibit prolifiammatory cytokine-induced apoptosis by activation of the Ser/Thr protein kinase Akt. Akt dissociates complexes of Bol-2 family members, such as BAD-Bol-2, releasing Bol-2 and its family members, such as BAD-Bol-2, releasing Bol-2 and its family members, such as BAD-Bol-2, releasing Bol-2 and its family members, such as BAD-Bol-2, releasing Bol-2 and its family members, such as BAD-Bol-2, releasing Bol-2 and its family members which inhibit caspases, thereby inhibiting apoptosis. An activation of JNK, a proapoptotic signaling component. Within several minutes after binding to the receptor, PRAs block JNK activation of JNK by TNF alpha is another well known mechanism for TNF alpha-induced by tumor necrosis factor-alpha (TNF alpha). The activation of JNK by TNF alpha is another well known mechanism for TNF alpha is other proinflammatory cytokine-induced apoptosis. The method can be used for inhibiting apoptosis with a disease, irritable bowel syndrome, asthma, cardiac apoptosis associated with a disease, is themmatory such and the disease, infarction, congestive heart failure, multiple sclerosis, acute and toxin-induced apoptosis, and disease, dillannatory leukoencephalitis, progressive multifocal leukoencephalitis, according and toxin induced sease, Guillannatory neurodegenerative disease, and toxin-induced sease. This peptide corresponds to amno acids 8 to 29 of human saposin C (See Aww85653) and acts as prosaposin receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A; Title: Sulfatide activator protein. Alternative splicing that generates three mRNAs a A; Accession: S36988; MUID:91210267; PMID:2019586
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A. Cross-references: EMBL: NUD: 9337759; PIDN: AAA36594.1; PID: 9337760
A: Note: the nucleotide sequence was submitted to the EMBL Data Library, June 1991
A: Note: the nucleotide sequence was submitted to the EMBL Data Library, June 1991
A: Note: exerbroaside sulfate activator protein mutant MU-9; corresponds to alternative shancession: S36989
A: Status: nucleic acid sequence not shown; translation not shown
A: Molecule type: mRNA
A: Residues: 1-240, S/, 242-259, 263-527 < HO2>

A;Title: Blosynthesis and molecular cloning of sulfated glycoprotein 1 secreted by ra
A;Reference number: A28716; MUID:89000647; PMID:3048385
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    C. Function:
A; Description: saposins bind sphingolipids, form hydrophilic complexes and make them
A; Pathway: sphingolipid catabolism
A; Pathway: sphingolipid catabolism
A; Pathway: sphingolipid catabolism
A; Note: saposins A and C (SAP-1) activate hydrolysis of galactocerebroside by beta-gluc
A; Note: saposin B (SAP-1) activates hydrolysis of galactocerebroside sulfate by aryls
A; Note: saposin D activates hydrolysis of sphingomyelin by sphingomyelin phosphodiest
C; Superfamily: saposin; saposin repeat homology
C; Keywords: alternative splicing; glycoprotein; lysosomal storage disease; lysosome;

cill wall-binding protein homolog yvcE - Bacillus subtilis
C;Species: Bacillus subtilis
C;Species: Bacillus subtilis
C;Species: Bacillus subtilis
C;Species: Forcession: F70031
C;Accession: F70031
C;Accession: F70031
C;Accession: F70031

Hum. Mutat. 4:233-242(1994).

-I- FUNCTION: The lysosomal degradation of sphingolipids takes place by the sequential action of specific hydrolases. Some of these enzymes require specific low-molecular mass, non-enzymic proteins: the sphingolipids activator proteins (coproteins).

-I- FUNCTION: Saposin A and saposin C stimulate the hydrolysis of glucosylceramide by beta-glucosylceramidase (EC 3.2.1.45) and galactosylceramide by beta-galactosylceramidase (EC 3.2.1.46). Saposin C apparently acts by combining with the enzyme and action to form an activated complex, rather than by solubilizing

- FUNCTION: THE LYSOSOMAL DEGRAPATION OF SPHINGOLIPIDS THESE
BY THE SEQUENTIAL ACTION OF SPECIFIC HYDROLASES. SOME OF THESE
ENZYMES REQUIRE SPECIFIC LOW-MOLECULAR MASS, NON-ENZYMIC PROFEINS:
THE SPHINGOLIPIDS ACTIVATOR PROTEINS (COPROFEINS) (BY SIMILARITY).
- FUNCTION: SAPOSIN A AND SAPOSIN C STIMULATE THE HYDROLYSIS OF
GLUCOSYLCERAMIDE BY BETA-GLUCOSYLCERAMIDASE (EC 3.2.1.45) AND
GALACTOSYLCERAMIDE BY BETA-GLUCOSYLCERAMIDASE (EC 3.2.1.45) AND
GALACTOSYLCERAMIDE BY BETA-GLUCOSYLCERAMIDASE (EC 3.2.1.45).

SAPOSIN-C APPARERYLY ACTS BY COMBINING WITH THE ENZYME AND ACIDIC
LIPID TO FORM AN ACTIVATED COMPLEX, RATHER THAN BY SOLUBILIZING
THE SUBSTRATE (BY SIMILARITY).

CEREBROSIDE SULFATE BY ARYLSULFATASE A (EC 3.1.6.8), GMI
CANGLIOSIDES BY BETA-GALACTOSIDASE (EC 3.2.1.33) AND
GLOBOTRIAOSYLCERAMIDE BY ALPHA-GALACTOSIDASE A (EC 3.2.1.22).
SAPOSIN-B FORMS A SOLUBILIZING COMPLEX WITH THE SUBSTRATES OF THE
SPHINGOLIPID HYDROLASES (BY SIMILARITY).

-1- FUNCTION: SAPOSIN D IS A SPECIFIC SPHINGOWELIN PHOSPHODIESTERASE
ACTIVATOR (EC 3.1.4.12) (BY SIMILARITY).

-1- SUBGUIT: SAPOSIN D IS A HOMODIMER (BY SIMILARITY).

-1- SUBGUIT: SAPOSIN D IS A HOMODIMER (BY SIMILARITY).

-1- SUBGUIT: SAPOSIN B IS A HOMODIMER (BY SIMILARITY).

-1- PTM: THIS PRECURSOR IS PROTEDITIOLALLY PROCESSED TO 4 SMALL PTM: THIS PRECURSOR IS PROTEDITIOLALLY PROCESSED TO BEPTIDES, WHICH ARE SIMILAR TO EACH OTHER AND ARE SPHINGOLIPID HYDROLASE ACTIVATOR PROTEINS (BY SIMILARITY: CONTAINS 2 SAPOSIN A-TYPE DOMAINS.

-1- SIMILARITY: CONTAINS 4 SAPOSIN B-TYPE DOMAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

"Determination of the primary structure of PLC-154 demonstrates diversity of phosphoinositide-specific phospholipase C activities."; Cell 54:171-177(1988).
                                                                                                                                                                                                                                                                                                                                                                                                                                                  -i- CATALTIC ACTIVITY: 1-phosphatidyl-1D-myo-inositol 4,5-
bisphosphate + H(2)0 - D-myo-inositol 1,4,5-trisphosphate +
diacylglycarol.
-i- COFACTOR: Calcium.
-i- MISCELLANEOUS: THE RECEPTOR-MEDIATED ACTIVATION OF PLC-BETA 1 IS
MEDIATED BY TWO G-PROTEIN ALPHA SUBUNITS, ALPHA-Q AND ALPHA-11.
-i- SIMILARITY: DOMAINS X AND Y ARE CONSERVED IN DIFFERENT FORMS
OF PLC AND ARE ESSENTIAL FOR CATALTIC ACTIVITY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           PROSITE; PS50004; C2_DOMAIN_2; 1.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
